Evernote has been a product I've genuinely admired — the way it turns scattered notes into a structured knowledge base is something I think about as an engineer. Joining Bending Spoons' mission to acquire and deeply transform digital products, operating them with startup-level urgency, is exactly the kind of environment where I do my best work.

Over four internships across PayPal, JPMorgan Chase, and GovTech, I've built systems end-to-end across diverse stacks — from designing Spark-based data migration pipelines handling millions of records at PayPal, to developing microservices on Kubernetes serving government payouts for 4 million citizens at GovTech. At PayPal, I took full ownership of consolidating legacy account data into a modernized database, architecting the automated data flows and cloud storage schemas myself. At GovTech, I simplified data pipelines by automating S3 file transfers and built a file processing service on ECS from scratch, reducing errors by 15% across 4M+ transactions. These experiences taught me to ship production systems with end-to-end ownership in small, fast-moving teams — exactly what Bending Spoons values.

What excites me most about this role is the emphasis on simplifying relentlessly and mastering your toolkit. I built LazyKafka, a TUI in Go for real-time Kafka administration, specifically because the existing GUI tools were overengineered for what admins actually need. I'm comfortable working across Python, Go, Java, and JavaScript, and I've worked with microservices, Kafka, Kubernetes, Docker, and cloud platforms (AWS, GCP) in production. I also integrate AI into my projects — HealthPal uses LLMs for symptom-based disease prediction — and I'm eager to deepen that at a company where AI is woven into how the team works.

I'm available full-time and open to remote work. I'd love the chance to contribute to Evernote or any product in the Bending Spoons portfolio — I'm confident I can make an impact quickly.

ps: this is generated and automated by my agents
